ACCOUNTS service — integration notes for channel teams

This page describes the behaviour of the ACCOUNTS service as deployed in all six markets. It is the system of record for customer accounts. Channel teams integrate against it as described here; the service itself is not changed for individual channel projects.

1. Transport

SOAP 1.1 / XML over HTTPS, reachable only across the site-to-site VPN. WSDL per market on request from cbs-platform@. There is no REST interface. UAT access requires a client certificate issued by CBS Operations; current lead time is two to three weeks.

2. Operations used by onboarding

Operation	Behaviour
OpenAccount	Creates the customer record if absent and opens a current account. Synchronous. Typical completion **20–90 seconds**; p99 is longer during branch opening hours. Accepts an optional free-text `ChannelReference` (32 chars) which is stored on the account and returned by lookups. **It is not used for duplicate detection.**
FindCustomerAccounts	Returns accounts for a customer identified by **national ID only**. Lookup by passport number is on the roadmap (CBS-4471, unscheduled). Reads are served from the reporting replica; an account opened by `OpenAccount` becomes visible here **within 60 seconds**, usually sooner.

3. Idempotency

There is none. `OpenAccount` carries no idempotency key or request identifier. A repeated call with the same customer data opens a second account for that customer. Closing an account opened in error is a branch back-office procedure and is not available over the interface.

4. Timeouts

A client-side timeout does not indicate that the operation failed. The account may or may not have been opened. The only way to establish which is to call `FindCustomerAccounts` after the replica delay in §2 and inspect the result.

5. Availability

The service is unavailable for end-of-day processing **22:00–06:00 local market time**, every day, in each market. Calls during the window are rejected with fault `EOD_IN_PROGRESS`. Local time is the market's own; the six markets span three time zones.

6. Capacity

The platform is shared by all channels. A ceiling of **5 concurrent in-flight calls** per market is enforced at the gateway across all callers combined; a sixth call is rejected with `CONCURRENCY_LIMIT` rather than queued. Branch systems account for most of this capacity during opening hours. Raising the ceiling requires a platform change request and is not planned for 2026.

7. Faults

Code	Meaning	Safe to retry?
EOD_IN_PROGRESS	Market is in the end-of-day window	After the window
CONCURRENCY_LIMIT	Ceiling in §6 reached	Yes
VALIDATION	Request rejected before processing	No — fix the request
(timeout)	No response within the client's deadline	**See §4**

Questions to cbs-platform@. Changes to this page are reviewed by the CBS Architecture Board. Channel teams should not rely on behaviour not documented here.
